

Mobile Source Control Measures (Draft)

Chris Lindhjem

ENVIRON International

Purpose of Study

- 8-Hour Ozone Ambient Standard (2018)
 - Menu of control options for mobile sources
 - Do the measures pass the minimum criteria?
 - Assess potential and feasibility of control strategies
 - Strategy emission reduction potential and cost effectiveness
- Process
 - Draft master list (this presentation)
 - Final master list (August)
 - Draft short list (ones to be analyzed in detail)
 - Final short list

Study Initiation

- Review of 2006 Report
 - Add/subtract strategies
 - Consider the impact of new timeframe
- Stakeholder involvement
 - H-GAC conducted a series of meetings with industry groups to review the master list
 - This venue
 - Other stakeholder suggestions and comments

Qualitative Evaluation

- All strategies included if they have any emission reduction potential
 - 2018 emission inventory and reduction goal not yet available
 - Level of implementation uncertain
- Reconsider the EPA Criteria
 - Permanent
 - Quantifiable
 - Surplus
 - Enforceable (for voluntary measures must demonstrate funding and administration)

Measures Evaluation

- Measure definition
 - If not self explanatory, provide a definition that corresponds to the suggested strategy
- Identify the source category
- Primary emission affected
- Any measurable effect on emissions
- Comment
 - Provide further description, identify suggested programs implemented elsewhere, or note other considerations when evaluating the strategy
