

# HGB Ozone SIP Modeling Overview

Zarena Post

Air Quality Division, TCEQ

Presented to

Houston-Galveston Area Council/  
Regional Air Quality Planning Committee

July 31, 2008

**Texas Commission on Environmental Quality**

# Why Model Ozone?

- Section 182 of the 1990 Federal Clean Air Act Amendments lists SIP Requirements:  
For areas classified as “serious,” develop an attainment demonstration SIP based on photochemical grid modeling
- EPA Guidance Documents
  - ▶ “Guidance on the Use of Models and Other Analyses for Demonstrating Attainment of Air Quality Goals....”  
(April 2007)

# Ozone Formation

Ozone is a secondary pollutant

- ▶ Not emitted directly into atmosphere
- ▶ Forms via a complex chemical process

Photochemical reaction

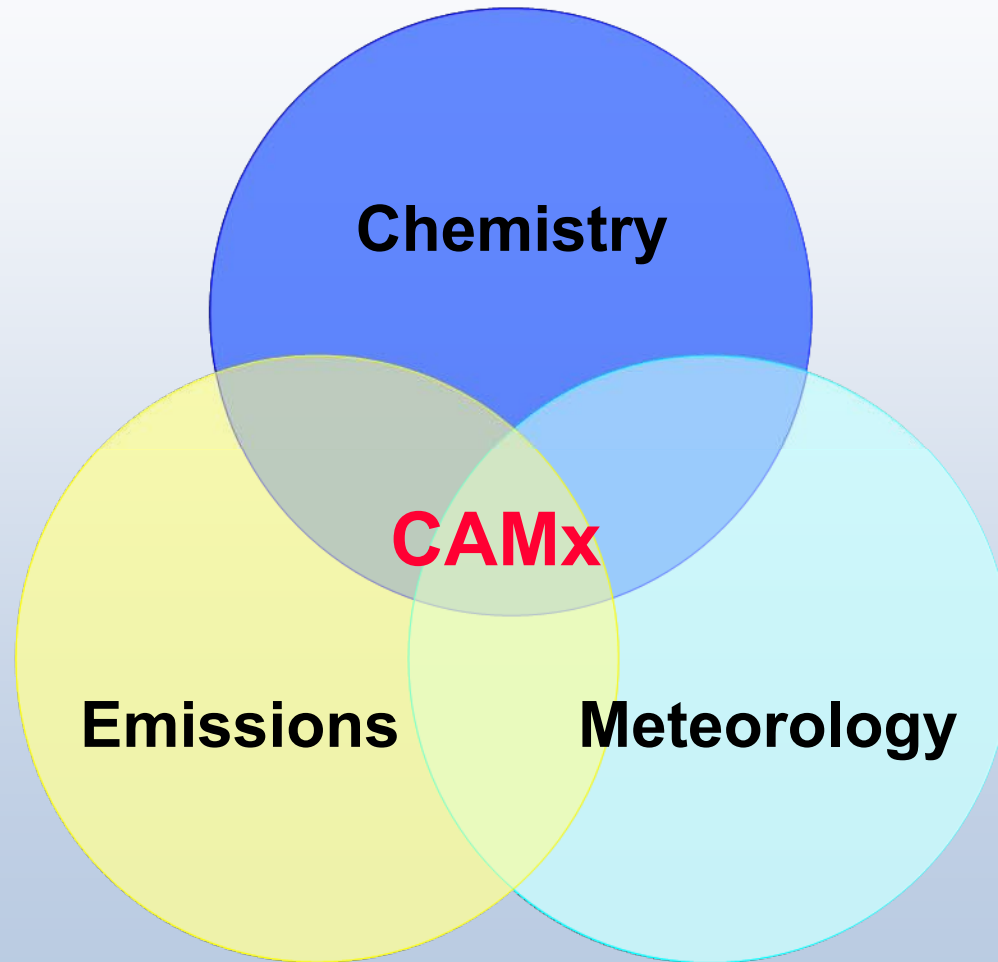

- ▶ Requires UV energy from sunlight, so
- ▶ Ozone forms during daytime, decreases at night

Complex chemical reaction between

- ▶  $\text{NO}_x$  - Nitrogen Oxides (NO,  $\text{NO}_2$ )
- ▶ VOCs - Volatile Organic Compounds

# CAMx Modeling Inputs

# CAMx Ozone Modeling in SIP Development

Base Case

Day-specific emissions and meteorology; replicate what actually happened; 2005, 2006

Baseline Case

Typical emissions and day-specific meteorology; used as basis for calculating future design values

Future Base Case

Apply future growth and on-the-books controls to estimate future ozone; 2018

Project  $DV_{Future}$

Use baseline design value and Future Base and Baseline modeling results

Test Control Strategies

Determine the control strategies and reductions that will effectively reduce ozone

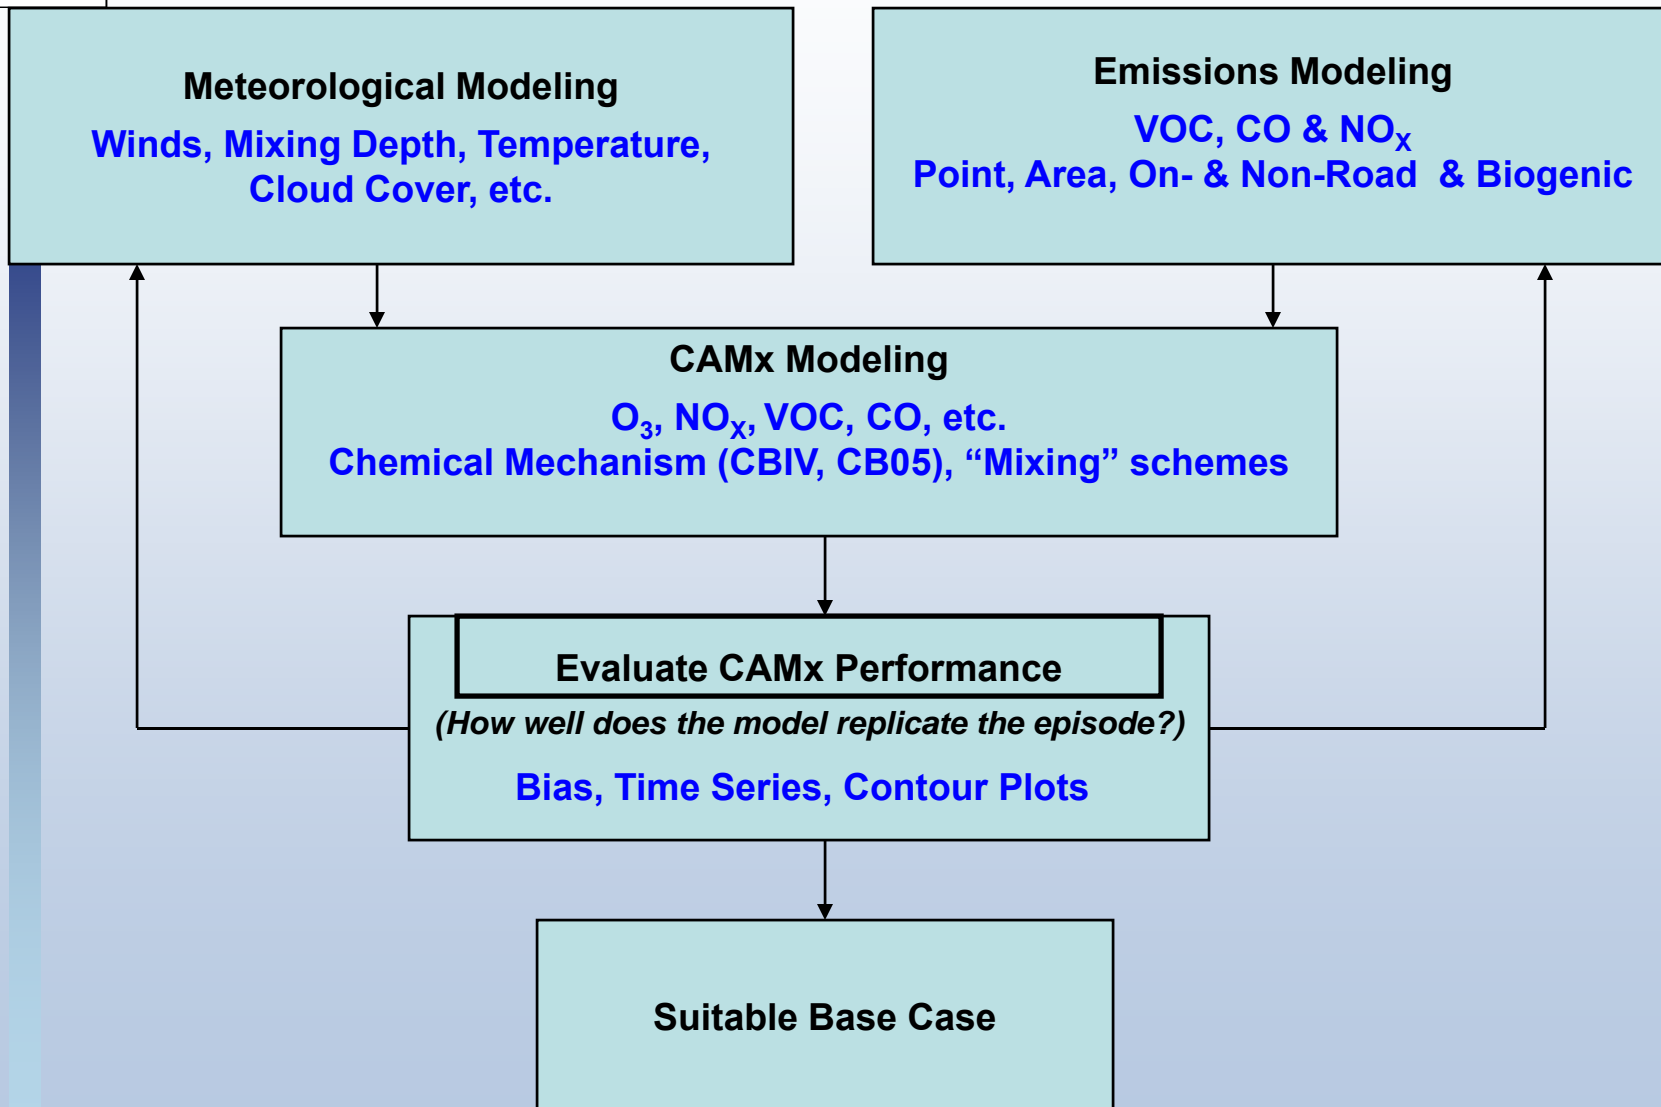

Write SIP

Document modeling procedures, attainment demonstration, and weight of evidence

# CAMx Ozone Modeling in SIP Development

## Base Case – Historical Episode Replication

# Features of 8-Hour Ozone Modeling

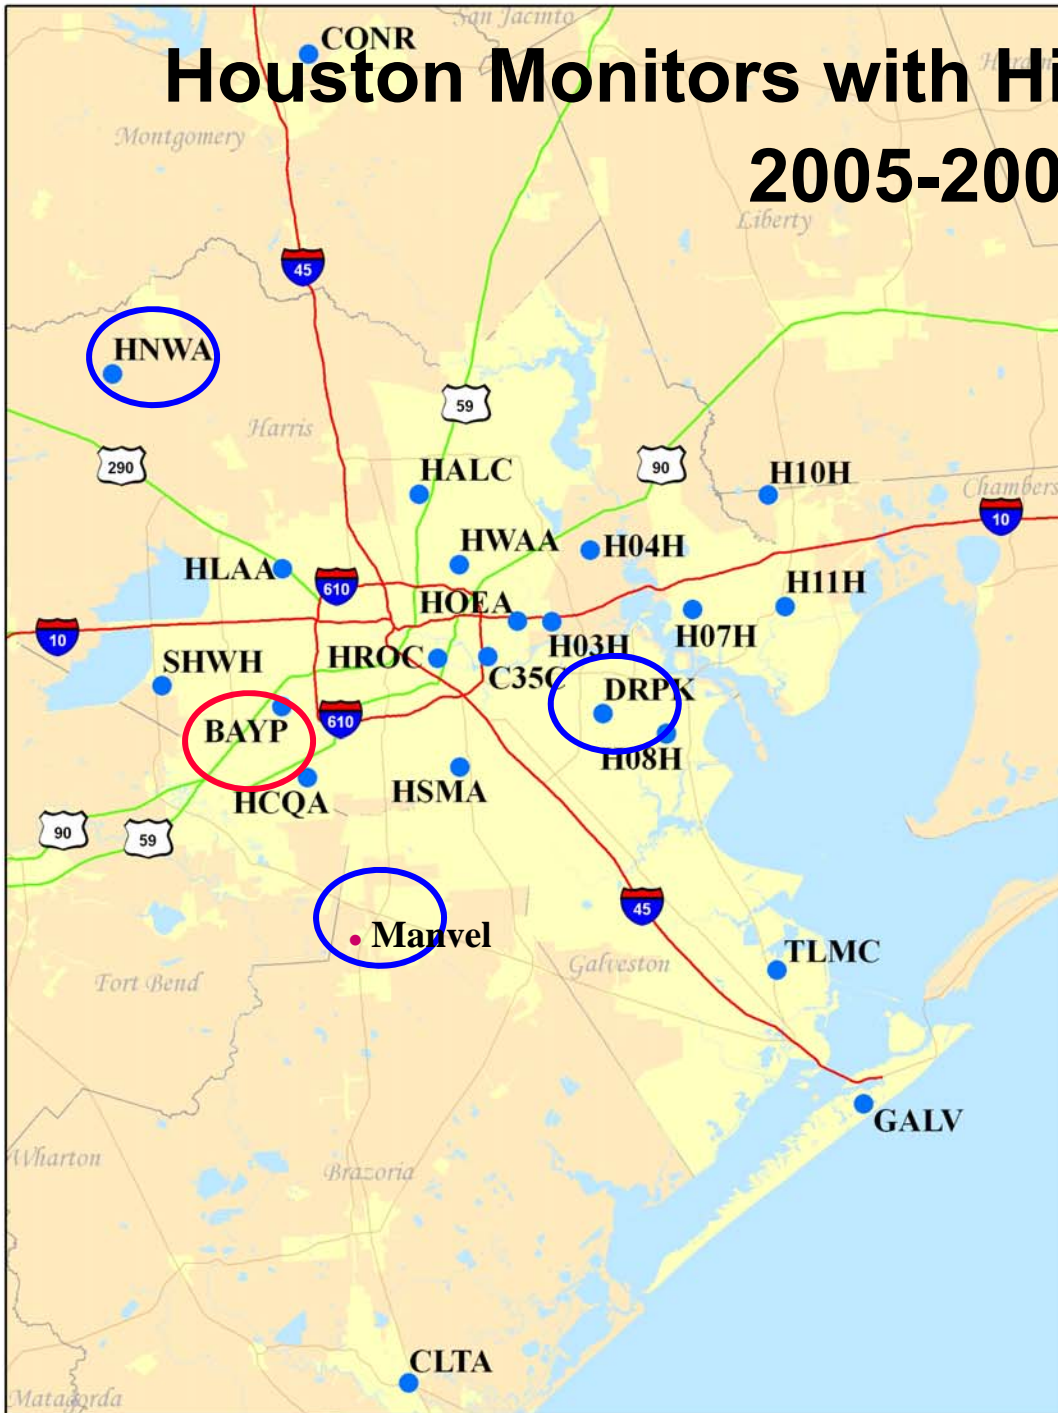

- Uses Relative Response Factor (RRF) approach to project future design value ( $DV_{\text{Future}}$ )
  - ▶ Combines Future Base and Baseline modeling results
  - ▶ RRF = ratio of Future and Baseline modeling results
  - ▶ RRF represents predicted percent change
  - ▶  $DV_{\text{Future}} = DV_{\text{Baseline}} \times \text{RRF}$
- EPA recommends using a minimum number of 10 days  $\geq 85$  ppb be included in the RRF calculation for each monitoring site

# Ozone Meteorology

- Clear (or partly cloudy) skies,
  - ▶ Limited clouds allows solar energy to reach the surface
  - ▶ Lots of Ultraviolet energy to make ozone
  - ▶ Strong surface heating
- High temperatures
  - ▶ Mix the air vertically
  - ▶ Accelerate the chemistry and
  - ▶ Speed up ozone formation
- Low wind speeds
  - ▶ Weak Winds → limited dispersion, dilution
  - ▶ Air stays in one place for a long time
  - ▶ Coastal areas get flow reversal

# Sources of Precursor Chemicals

- Nitrogen Oxides come from combustion
  - ▶ Cars, trucks, boats, engines
  - ▶ Industrial smokestacks,
  - ▶ Electrical power plants
- VOCs come from evaporation and incomplete combustion
  - ▶ Industrial/petrochemical facilities
  - ▶ Solvents evaporation
  - ▶ Gasoline and other fuels
  - ▶ Plants, particularly oak trees

# Emissions Inventory Categories

- Point Sources
  - ▶ Industrial sources (Petrochemical and Electric Generating)
- On-Road Mobile sources
  - ▶ Cars, trucks, buses, motor cycles, 18 wheelers
- Non-Road sources
  - ▶ Trains, planes, boats, construction equipment, pumps etc
- Area Sources
  - ▶ Dry Cleaners, Gas stations, Bakeries
- Biogenic Sources
  - ▶ Oak and Pine Trees, Vegetation, Farming

# Inputs Combined into One Model

- Chemistry Equations

- ▶ Chemistry changes during day and night
- ▶ 51 chemical groups, 156 reactions
- ▶ Complex system of differential equations

- Meteorological Data

- ▶ Wind transports and mixes pollutants
- ▶ Temperature affects reaction rates
- ▶ Sunlight provides energy (ultraviolet radiation)

- Emissions Inventory

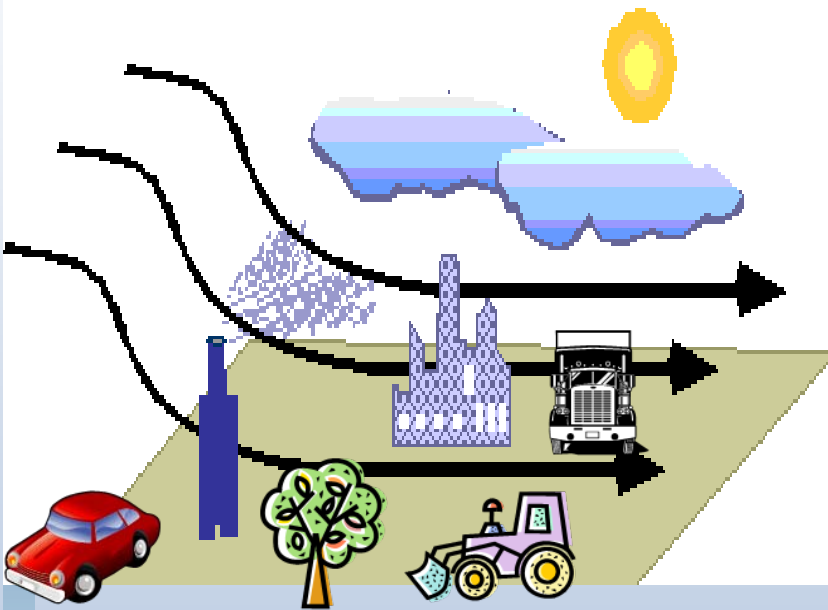

- ▶ Emissions from cars, planes, factories, power plants
- ▶ Nitrogen Oxides and Volatile Organic Compounds
- ▶ Speciation - Break VOC emissions down into chemical components

# TexAQS II Modeling Episodes

- 2005

- ▶ Episode0: May 19 - June 3, 2005
- ▶ Episode1: June 17 - June 30, 2005
- ▶ Episode2: July 27 - August 8, 2005

- 2006

- ▶ Episode 0: May 31-June 15, 2006
- ▶ Episode 1: August 13- September 15, 2006
- ▶ Episode 2: October 3 – October 11, 2006

# Goal of Ozone Modeling

- Get the right ozone concentrations at:
  - ▶ The right time
  - ▶ The right place
  - ▶ For the right reasons
- Get enough valid modeling days so the results are reliable
- Serves as a directional tool to provide information about what control strategies are expected to be helpful
