

Appendix E. Species Lists

The species lists contained herein are as complete as possible given the information available at the time of writing of this document. Please note that the ABWWG makes no claims that the list is completely comprehensive. When reviewing the species lists, the following should be considered:

1. While the list is large, most of the animals and plants contained in Appendix F have been greatly reduced in abundance

and distribution, with individuals now restricted to relatively small land areas,

2. The status of most of the listed species is unknown and the chance for long-term existence of their populations in the Armand Bayou Watershed is unknown, and
3. That many species listed in Appendix F may already have been extirpated from the watershed.

Species of birds observed in the Armand Bayou Watershed and Armand Bayou Coastal Preserve.

A Plant Checklist of a Harris County Flood Control Detention Basin, January 2001

Larry E. Brown, Houston Community College, 1300 Holman Avenue, Houston TX 77004

This checklist is dedicated to Ralph Taylor of the Harris County Flood Control District for his interest in the local flora, for encouraging the development of the checklist, and for his discovery of one of the rarest Texas plants (*Cyperus cephalanthus*) in this detention basin.

Introduction

The following is a checklist of all the vascular plants, native and introduced, that are present on the Harris Flood Control Basin located south of Spencer Highway in Pasadena. The checklist is based upon monthly trips beginning on March 21, 2000 and ending on September 23, 2000.

This site is a remnant native prairie positioned east of the Texas Chiropractic College and west of a trailer park housing site. It is north of Little Vince Bayou and southeast of the Beltway / Spencer Highway intersection. Prairie vegetation surrounds a detention basin that has been dug adjacent to the chiropractic college to alleviate downtown flooding along Little Vince Bayou, which flows southeast into Armand Bayou. The only other disturbance sites are a pipeline right of way across a section of the site and a deposit of dirt fill along a portion of the pipeline right of way.

Most of the plant species are typical of a prairie including species that are found in prairie pot hole wet habitats. Weedy species grow around and in the detention basin and on the deposit of dirt.

During the seven months of fieldwork, the following habitats were identified along with some species that are found only or mostly in these habitats.

Prairie: This is the largest plant community. The following are some of the plants of this habitat, *Manfreda virginica*, *Eryngium uccifolium*, *Ascepias verticillata*, *Ambrosia psilostachya*, *Aster ericoides*, *Helianthus maximillani*, *Liatris pycnostachya*, *Pityopsis graminifolia*, *Sceleria ciliata*, *Dalea candida* var. *candida*, *Krameria lanceolata*, *Bouteloua curtipendula*, *Coelorachis cylindrical*, *Muhlenbergia capillaries*, *Schizachyrium scoparium*, *Salvia azurea*, *Tridens strictus*, *Tripsacum dactyloides*, and *Andropogon gerardii*.

Plants of disturbed areas: These plants are in the detention basin depression, on fill dirt and on the prairie margins. The typical plants are, *Cynodon dactylon*, *Chloris canterina*, *Bothriochloa ischaemem*, *Torilis arvensis*, *Torilis nodosa*, *Aster subulatus*, *Helianthis annuus*, *Hypochaeris microcephala*, *Pyrrhopappus pauciflorus*, *Senecio tampicanus*, *Solidago Canadensis*, *Sonchis asper*, *Medicago lupulina*, *M. polymorpha*, *Trifolium repens*, *Allium canadense*, *Ambrosia trifida*, *Paspalum urvillei*, and *Nothoscordium*.

Plants of wet flood control ditches: Some plants here are,

Alternanthera philoxeroides, *Ludwigia peploides* and *Amaranthus rudis*.

Plants of the prairie wetlands: Some of the plants here are, *Acmella oppositifolia*, *Panicum virgatum*, *Sagittaria* (two species), *Justicia ovata*, *Carex crus-ccorvii*, *Carew lupulina*, *Cyperis cephalanthus*, *Spartina pectinata*, *Cyperus haspan*, *Sesbania drummondii*, *Leersia hexandra*, and *Paspalum lividum*.

The following are significant plant finds and some comments about their significance:

- *Aster ericoides* L. This is a rare species in the Houston area. It is usually found only in pristine prairies.
- *Eupatorium hyssopifolium* L. This is another rare species in the Houston area. It is found only in high quality prairies.
- *Cyperus cephalanthus* T. & H. This is one of the rarest plants in Texas, if not the rarest. It was first discovered in Texas in 1835 near Galveston Bay with the exact locality unknown. It has not been seen since in Texas until Ralph Taylor discovered a population at this site in 1999. In 1993, Carter and McInnis published a status report on this species and reported 18 sites in the Louisiana coastal prairies. In Texas, they searched for it in the coastal prairies of Chambers and Harris counties but without success. Because of the construction pending at the detention basin, Ralph Taylor has transferred most of the plants of this species to the nursery at the Greens Bayou Mitigation Bank, where they are now growing. After the proposed construction is completed here, it may be possible to transfer some plants back to the original site.
- *Trifolium pratense* L. This is my first Harris County collection of this agronomic clover. In the northern states it is planted for pasture improvement. A few plants were growing along the detention basin and arrived here probably in a ground cover seed mixture.
- *Krameria lanceolata* Torr. In the Houston area this prostrate herb with orchid-like flowers has been found in Harris and Waller counties. This is the second Harris County collection.
- *Cuphea glutinosa* Cham & Schlecht. This is the first Harris County record for this prostrate herb that is native to South America.
- *Bothriochloa Exaristata* (Nash) Henr. This grass, endemic to coastal prairies in southeast Texas and southwest Louisiana, is on the watch list of Texas most endangered species list. This is one of the few Harris county sites.
- *Coelorachis cylindrical* (Michx.) Nash This is another

rare prairie grass species. This is the second Harris County record in the SBSC herbarium. The other collection is east of this site from a prairie along Spencer Highway near the intersection with Center Street.

- *Spartina pectinata*. This is an extremely rare prairie grass in Harris County and apparently in Texas. I surveyed the Tracy Herbarium at Texas A&M University and found only two 1930 collections from two counties in the Texas panhandle. In Harris County, this typical northern prairie pot hole species is found in the upper headwaters of the Armand Bayou drainage system. The other local records are to the southeast near the intersection of Beltway 8 and Fairmont Parkway. Here one plant shared a low moist area with *Cyperus cephalanthus*. The coordinates of the site are 29°39'39"N and 95°08'50"W.

The species list beginning on page six is arranged alphabetically

by family, genus and species. The first two columns indicates the origin, i.e. **N** for those plants that are native to the United States, **I** for the non-native usually woody taxa. The second two columns indicates the form, i.e. woody or herbaceous. The third three columns indicates the principal flowering season, i.e. **V** for vernal (from late February to June), **S** for summer (from June through August), **F** for fall (from September through November and **W** for winter (December through early February). None of our species have their principal flowering period in winter.

Table 1 indicates that 56 families, 183 genera and 291 species were found during the study period from March 2000 through September 2000. The five largest families are the Poaceae with 33 genera and 63 species, the Asteraceae with 32 genera and 47 species, the Cyperaceae with 6 genera and 30 species, the Fabaceae with 14 genera and 27 species and the Apiaceae with 11 genera and 12 species.

The number of families (56) and species (291) on this small site in southern Harris County are comparable to the 108 families and 599 species on the larger 256 acres Mercer Arboretum along Cypress Creek in the northern portion of the county. The smaller detention basin species is due to the small size of the detention basin, the dominance of the prairie habitat and the absence of any significant habitats.
